HELLBURN

COMPETITIVE BURN-TO-EARN PROTOCOL

Built on TitanX | Burns DragonX | Real ETH Yield

WHITEPAPER v4.0 — Trustless Edition

March 2026

Disclaimer

This document is for informational purposes only and does not constitute financial, investment, or legal advice. Cryptocurrency and DeFi investments carry significant risk, including the potential loss of all invested capital. Smart contracts, despite testing and audits, may contain vulnerabilities. Past performance of similar protocols does not guarantee future results. All projections are hypothetical. DYOR.

1. Executive Summary

HellBurn is the first Competitive Burn-to-Earn Protocol in the TitanX ecosystem. It combines gamified, competitive burning with real ETH yield and creates perpetual deflationary pressure on both TitanX and DragonX.

While existing TitanX ecosystem protocols (DragonX, Helios, Hydra, B88) rely on a one-time minting phase followed by passive staking, HellBurn introduces Burn Epochs — competitive 8-day cycles where participants burn TitanX and DragonX to earn a proportional share of ETH rewards. A streak system rewards consistent participation with up to 3x multiplier.

The result: A self-reinforcing deflationary flywheel that runs in perpetuity. HellBurn strategically leverages the historic TitanX Day-888 payout (~727 ETH, ~$2.39M) as the ignition event.

New in v4.0 — Fully Trustless:

- No admin keys, no guardian, no pause function — the protocol runs autonomously once deployed.
- Initial liquidity is created entirely by the smart contract (Fair Launch) — LP locked forever.
- Treasury TitanX (22%) is auto-staked inside the contract for 3,500 days — no one can withdraw it. ETH yield flows to BuyAndBurn automatically.
- Every critical function (endGenesis, stakeTreasury, claimTreasuryYield, collectLPFees, executeBuyAndBurn) is callable by anyone. Zero admin dependencies.

Parameter	Value
Token	HBURN (ERC-20, Ethereum)
Core Mechanic	Competitive Burn Epochs + Payout Capture
Burn Targets	TitanX + DragonX (dual burn)
Yield	Real ETH from TitanX staking payouts
Supply	Fixed — mint only during 28-day Genesis, then permanently disabled
Initial Liquidity	Trustless — created by smart contract (Fair Launch)
Treasury	22% TitanX auto-staked in contract — yield → BuyAndBurn
Admin Keys	None — no owner, no guardian, no pause, fully autonomous
Launch Event	Before TitanX Day 888 (~April 2026)

2. The Problem — Why Existing Protocols Fall Short

2.1 One-Time Deflationary Pressure

Every TitanX ecosystem project follows the same pattern: A minting phase where users deposit TitanX to receive new tokens, a portion gets burned, and then the burn pressure stops completely.

2.2 Passive Staking Without Engagement

After minting, users stake their tokens and wait passively. This leads to declining engagement and a classic "mint → stake → forget → dump" cycle.

2.3 Missing Gamification

Without competitive and game-theoretic elements, there is no reason to return. The most successful DeFi protocols (Curve, Convex, GMX, Pendle) have proven that competitive mechanics are the strongest retention drivers.

2.4 Centralized Trust Requirements

Most protocols require trust in the founder: to create the LP pool fairly, to not drain the treasury, to not abuse admin keys. HellBurn v4.0 eliminates ALL of these trust requirements through smart contract automation.

3. The Solution — HellBurn’s Three Innovations

3.1 Burn Epochs: Perpetual Deflationary Pressure

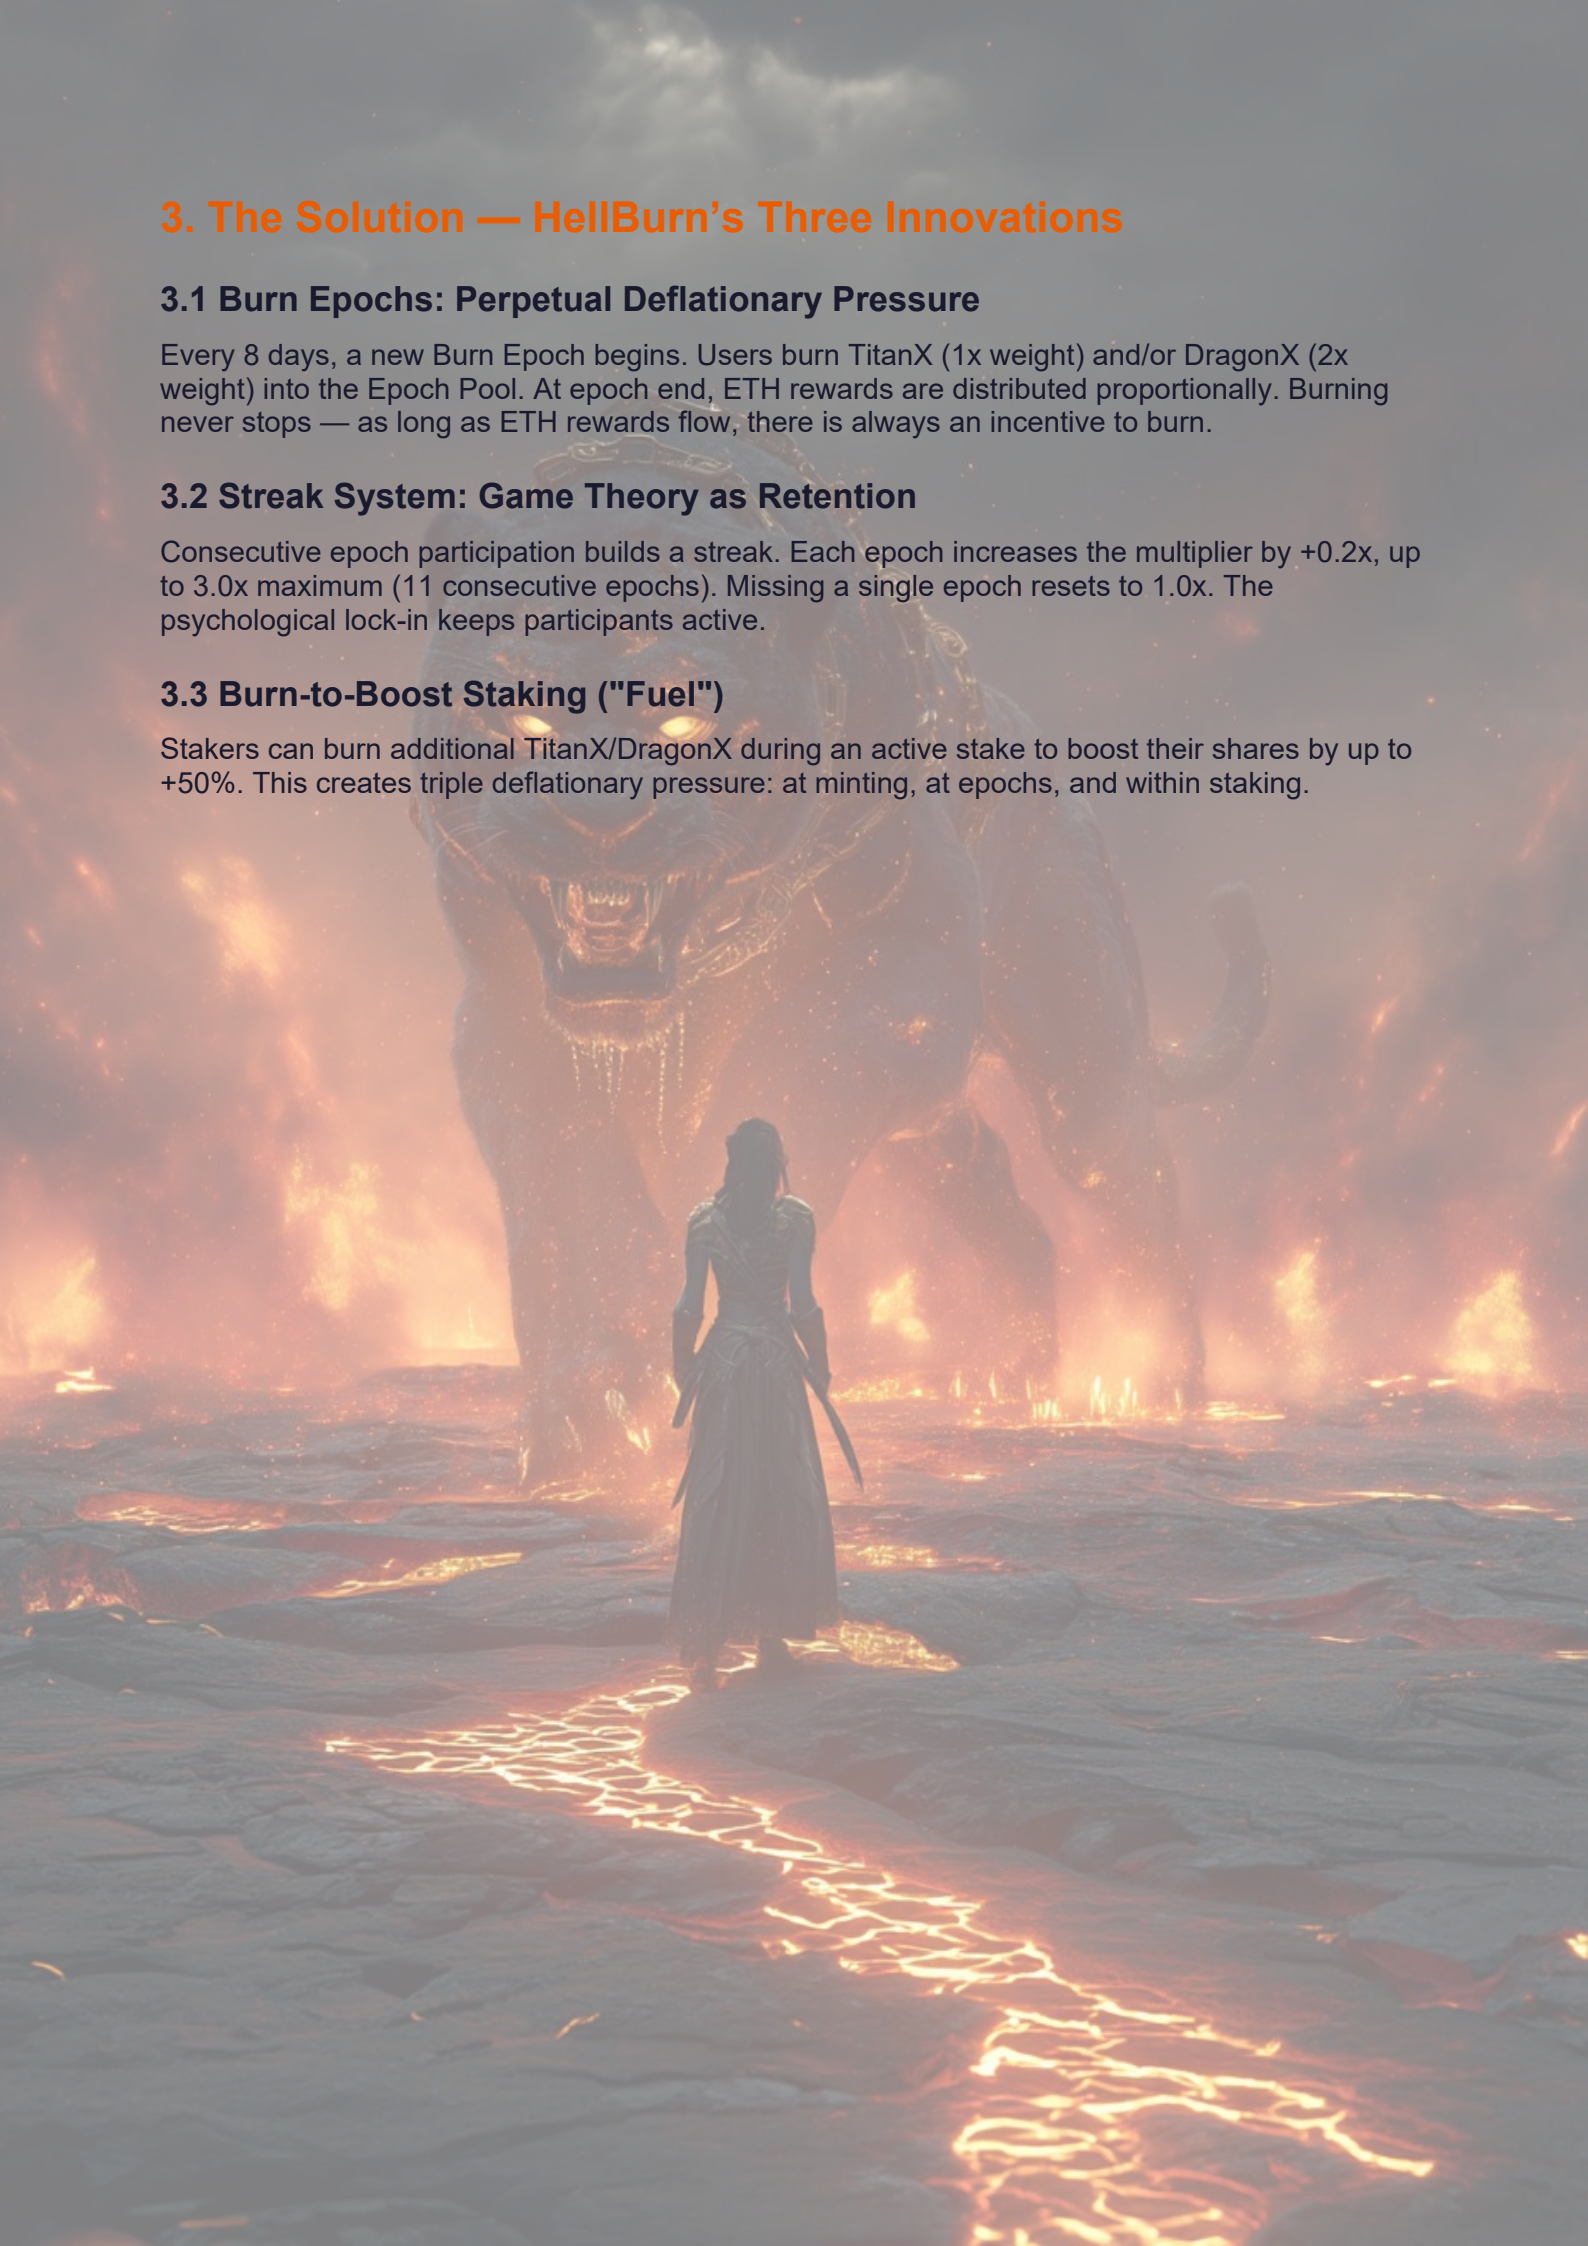
Every 8 days, a new Burn Epoch begins. Users burn TitanX (1x weight) and/or DragonX (2x weight) into the Epoch Pool. At epoch end, ETH rewards are distributed proportionally. Burning never stops — as long as ETH rewards flow, there is always an incentive to burn.

3.2 Streak System: Game Theory as Retention

Consecutive epoch participation builds a streak. Each epoch increases the multiplier by +0.2x, up to 3.0x maximum (11 consecutive epochs). Missing a single epoch resets to 1.0x. The psychological lock-in keeps participants active.

3.3 Burn-to-Boost Staking ("Fuel")

Stakers can burn additional TitanX/DragonX during an active stake to boost their shares by up to +50%. This creates triple deflationary pressure: at minting, at epochs, and within staking.



4. The Deflation Flywheel

Step 1:

Users burn TitanX/DragonX (via Genesis, Epochs, or Fuel)

Step 2:

35% permanently burned, 35% to DragonX Vault, 22% auto-staked in contract treasury (3,500 days), 8% accumulated for LP creation

Step 3:

Staked TitanX generates ETH at every payout cycle (8/28/90/369/888 days)

Step 4:

80% of epoch ETH flows to burners, 20% to BuyAndBurn (buys + burns HBURN)

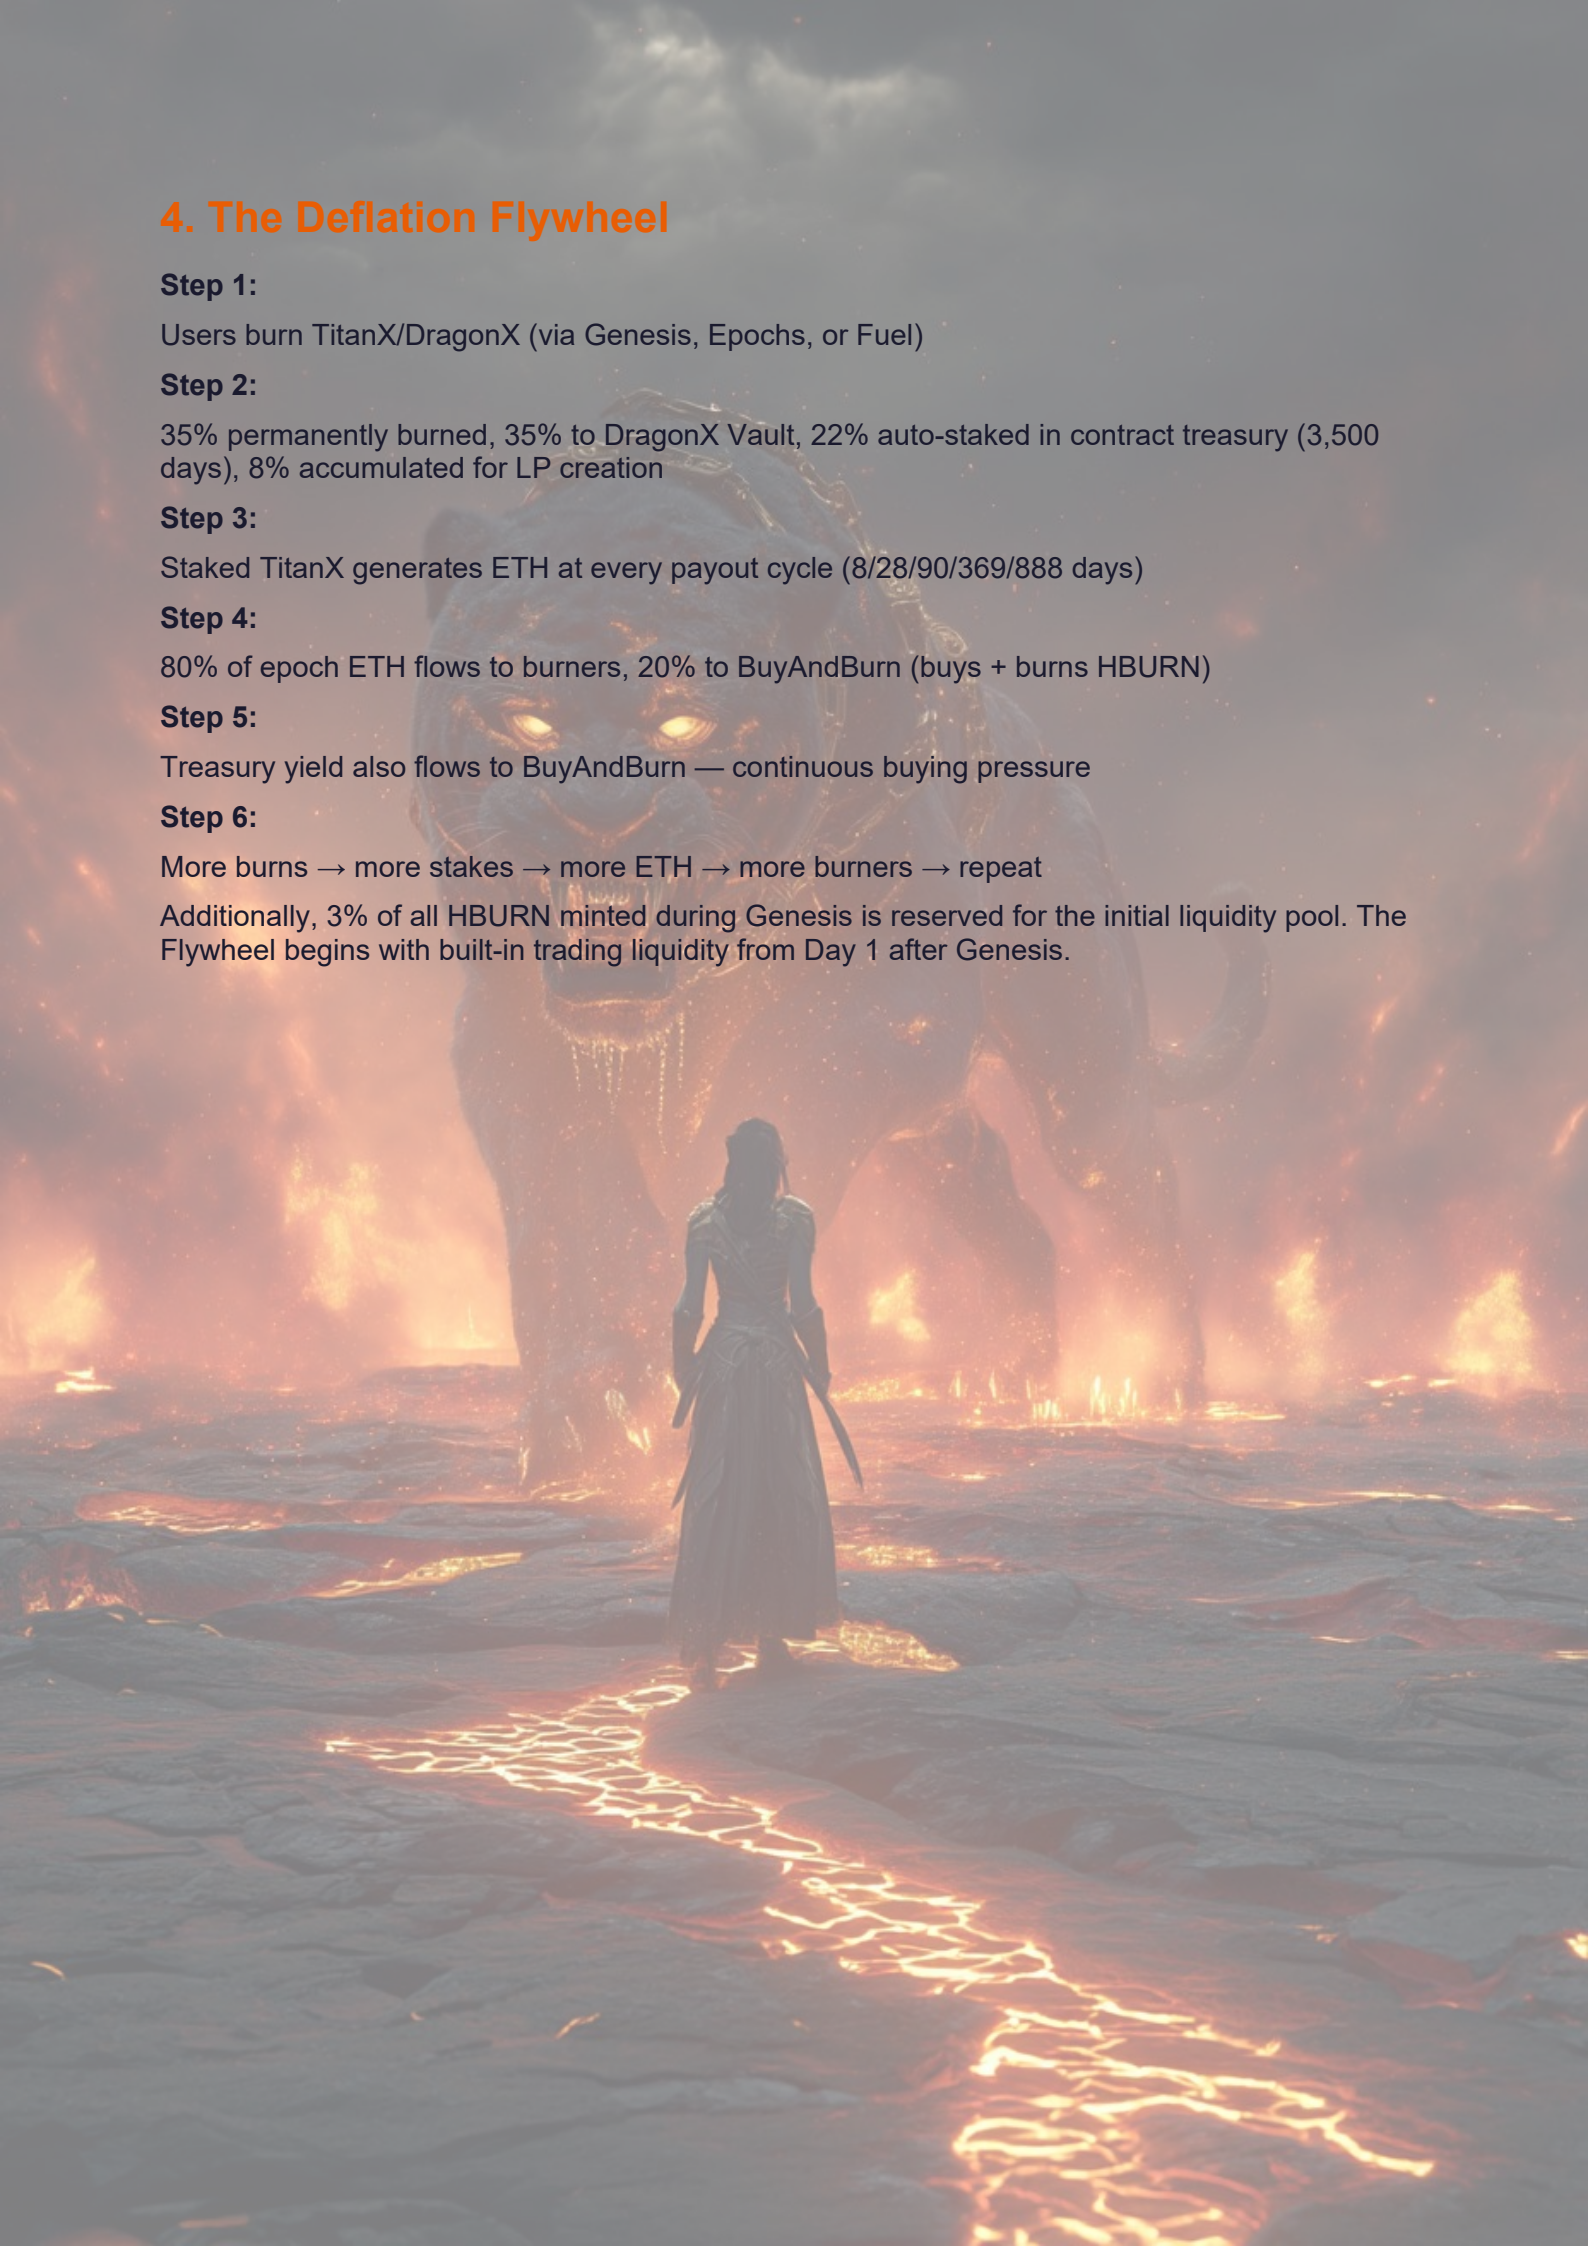
Step 5:

Treasury yield also flows to BuyAndBurn — continuous buying pressure

Step 6:

More burns → more stakes → more ETH → more burners → repeat

Additionally, 3% of all HBURN minted during Genesis is reserved for the initial liquidity pool. The Flywheel begins with built-in trading liquidity from Day 1 after Genesis.



5. Trustless Architecture (NEW in v4.0)

This is the defining feature of HellBurn v4.0. The entire protocol operates without any human intervention after deployment. No admin keys, no guardian, no pause buttons, no multi-sig — pure smart contract automation.

5.1 Fair Launch LP — No Human Touches Liquidity

During the 28-day Genesis, two reserves accumulate inside the contract:

- **LP HBURN Reserve (3%):** Every HBURN mint sets aside 3% for the LP. Users receive 97%.
- **Genesis Fund (8% TitanX):** Stays in the contract, converted to WETH at genesis end.

When anyone calls endGenesis() after 28 days, the contract: (1) swaps TitanX to WETH, (2) creates a Uniswap V3 HBURN/WETH pool, (3) mints a permanent LP position. The LP NFT is locked forever in the contract — no withdraw function exists.

5.2 Trustless Treasury — No One Can Withdraw

In v4.0, the treasury TitanX STAYS in the Genesis contract.

After genesis ends, anyone can call stakeTreasury() to lock the TitanX in a 3,500-day TitanX stake. This generates ETH yield over the entire staking period. Anyone can then call claimTreasuryYield() to collect the accumulated ETH and forward it to the BuyAndBurn contract, where it buys HBURN on the open market and burns it.

The result:

- 22% of all Genesis TitanX generates permanent buying pressure on HBURN
- No human can touch the staked TitanX — it's locked for 3,500 days
- No human can redirect the ETH yield — it always goes to BuyAndBurn
- Both functions are callable by anyone — zero admin dependency

5.3 No Guardian, No Pause — Fully Autonomous

Many DeFi protocols include a "guardian" role that can pause the protocol. While intended for emergencies, this introduces centralization: the guardian can grief users by permanently pausing deposits or staking.

HellBurn v4.0 removes the guardian entirely. Once deployed, the contracts run autonomously:

- BurnEpochs: Burns and claims always work. No one can pause them.
- Staking: Stakes and unstakes always work. No one can freeze funds.
- GenesisBurn: Fully immutable from Day 1. No admin of any kind.
- BuyAndBurn: Callable by anyone. No access controls.

5.4 Trust Verification

Every claim in this whitepaper is verifiable on Etherscan:

Claim	How to Verify
No admin keys	Read contract source — no onlyOwner, no onlyGuardian modifiers
No pause	Search for "pause" in source — function does not exist
Treasury locked	Call treasuryInfo() — shows amount and staked status
LP locked forever	Contract holds LP NFT, no transfer/withdraw function

Supply fixed	genesisMintingEnded() returns true after genesis
All functions public	No access modifiers on endGenesis, stakeTreasury, etc.

6. Genesis Phase — Your Entry Point

The Genesis Burn Phase (28 days) is the only opportunity to mint HBURN. Users burn TitanX and receive HBURN at a decreasing ratio. 3% goes to the LP reserve; users receive 97%.

Week	Base Ratio	Early Bonus	Effective Rate	User Gets (97%)
Week 1 (Day 1-7)	1:1.00	+15%	1:1.15	1:1.1155
Week 2 (Day 8-14)	1:0.95	+10%	1:1.045	1:1.0137
Week 3 (Day 15-21)	1:0.90	+5%	1:0.945	1:0.9167
Week 4 (Day 22-28)	1:0.85	None	1:0.85	1:0.8245

Example: Alice burns 5B TitanX in Week 1

- Total HBURN minted: 5B × 1.15 = 5.75B HBURN
- LP Reserve (3%): 172.5M HBURN → stays in contract
- Alice receives (97%): 5.577B HBURN (25% instant + 75% vesting over 28 days)

Her 5B TitanX is distributed:

- 35% → permanently burned (1.75B to dead address)
- 35% → DragonX Vault (1.75B)
- 22% → auto-staked in contract treasury (1.1B, locked 3,500 days)
- 8% → Genesis Fund for LP creation (400M)

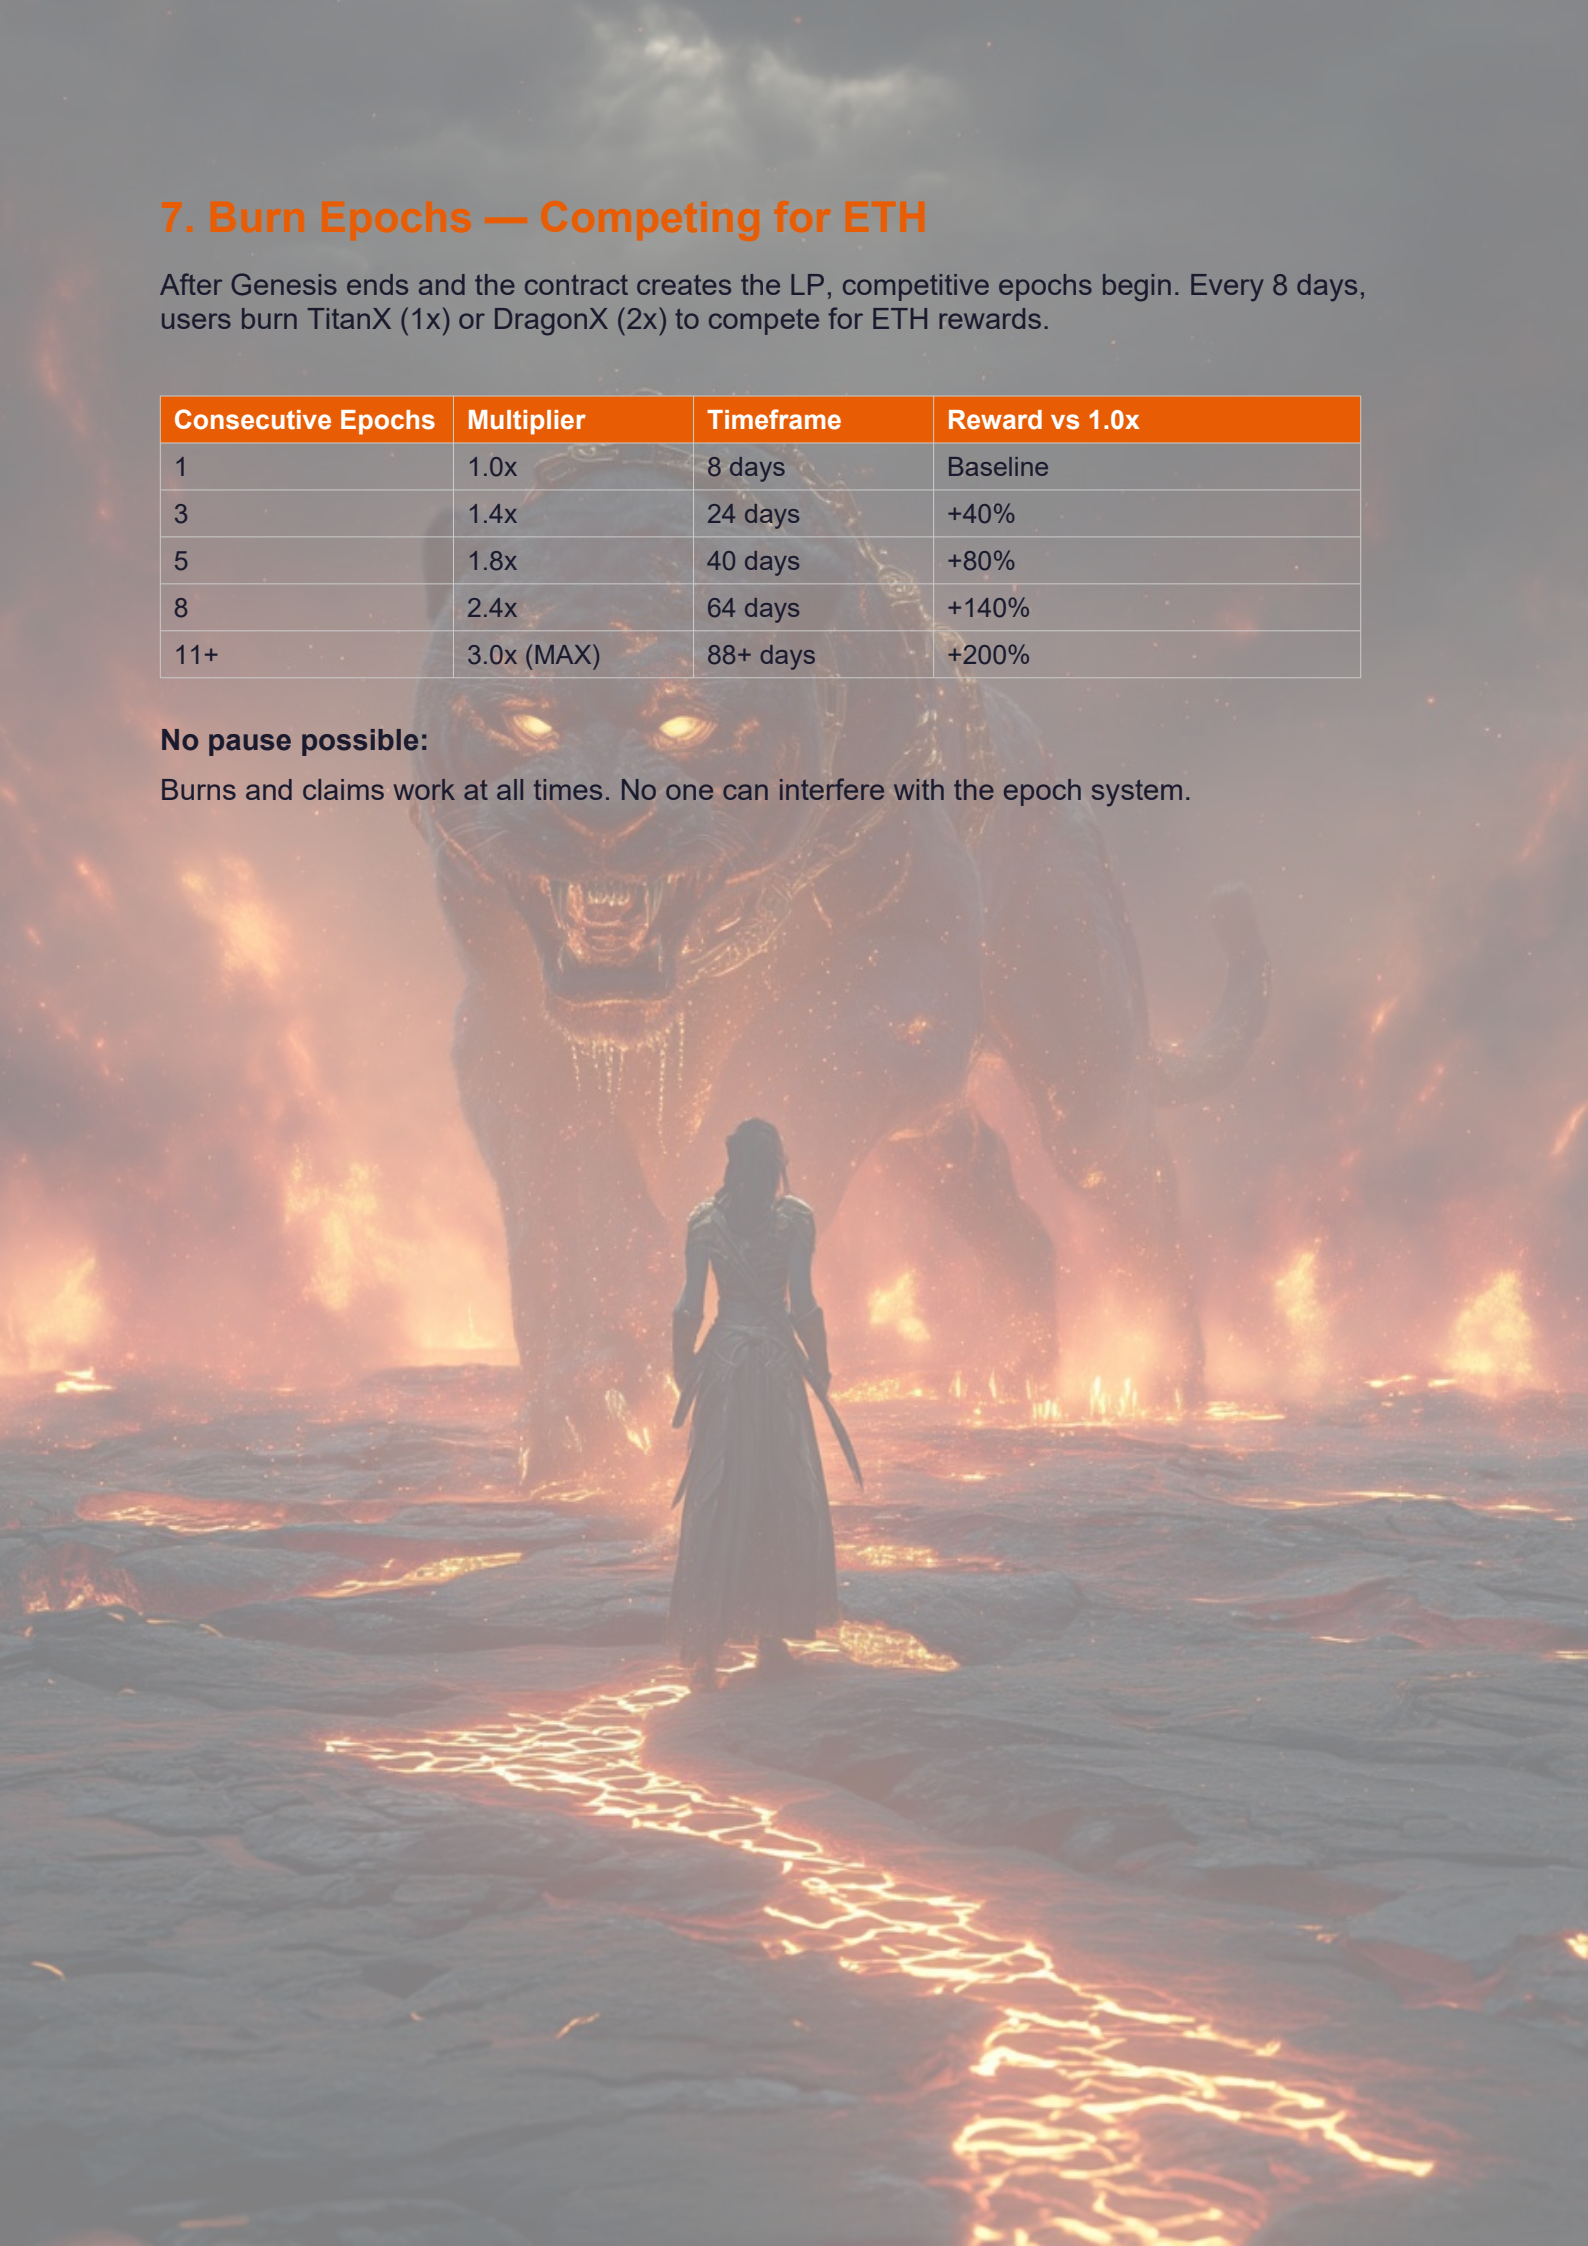
7. Burn Epochs — Competing for ETH

After Genesis ends and the contract creates the LP, competitive epochs begin. Every 8 days, users burn TitanX (1x) or DragonX (2x) to compete for ETH rewards.

Consecutive Epochs	Multiplier	Timeframe	Reward vs 1.0x
1	1.0x	8 days	Baseline
3	1.4x	24 days	+40%
5	1.8x	40 days	+80%
8	2.4x	64 days	+140%
11+	3.0x (MAX)	88+ days	+200%

No pause possible:

Burns and claims work at all times. No one can interfere with the epoch system.



8. Staking & Real Yield

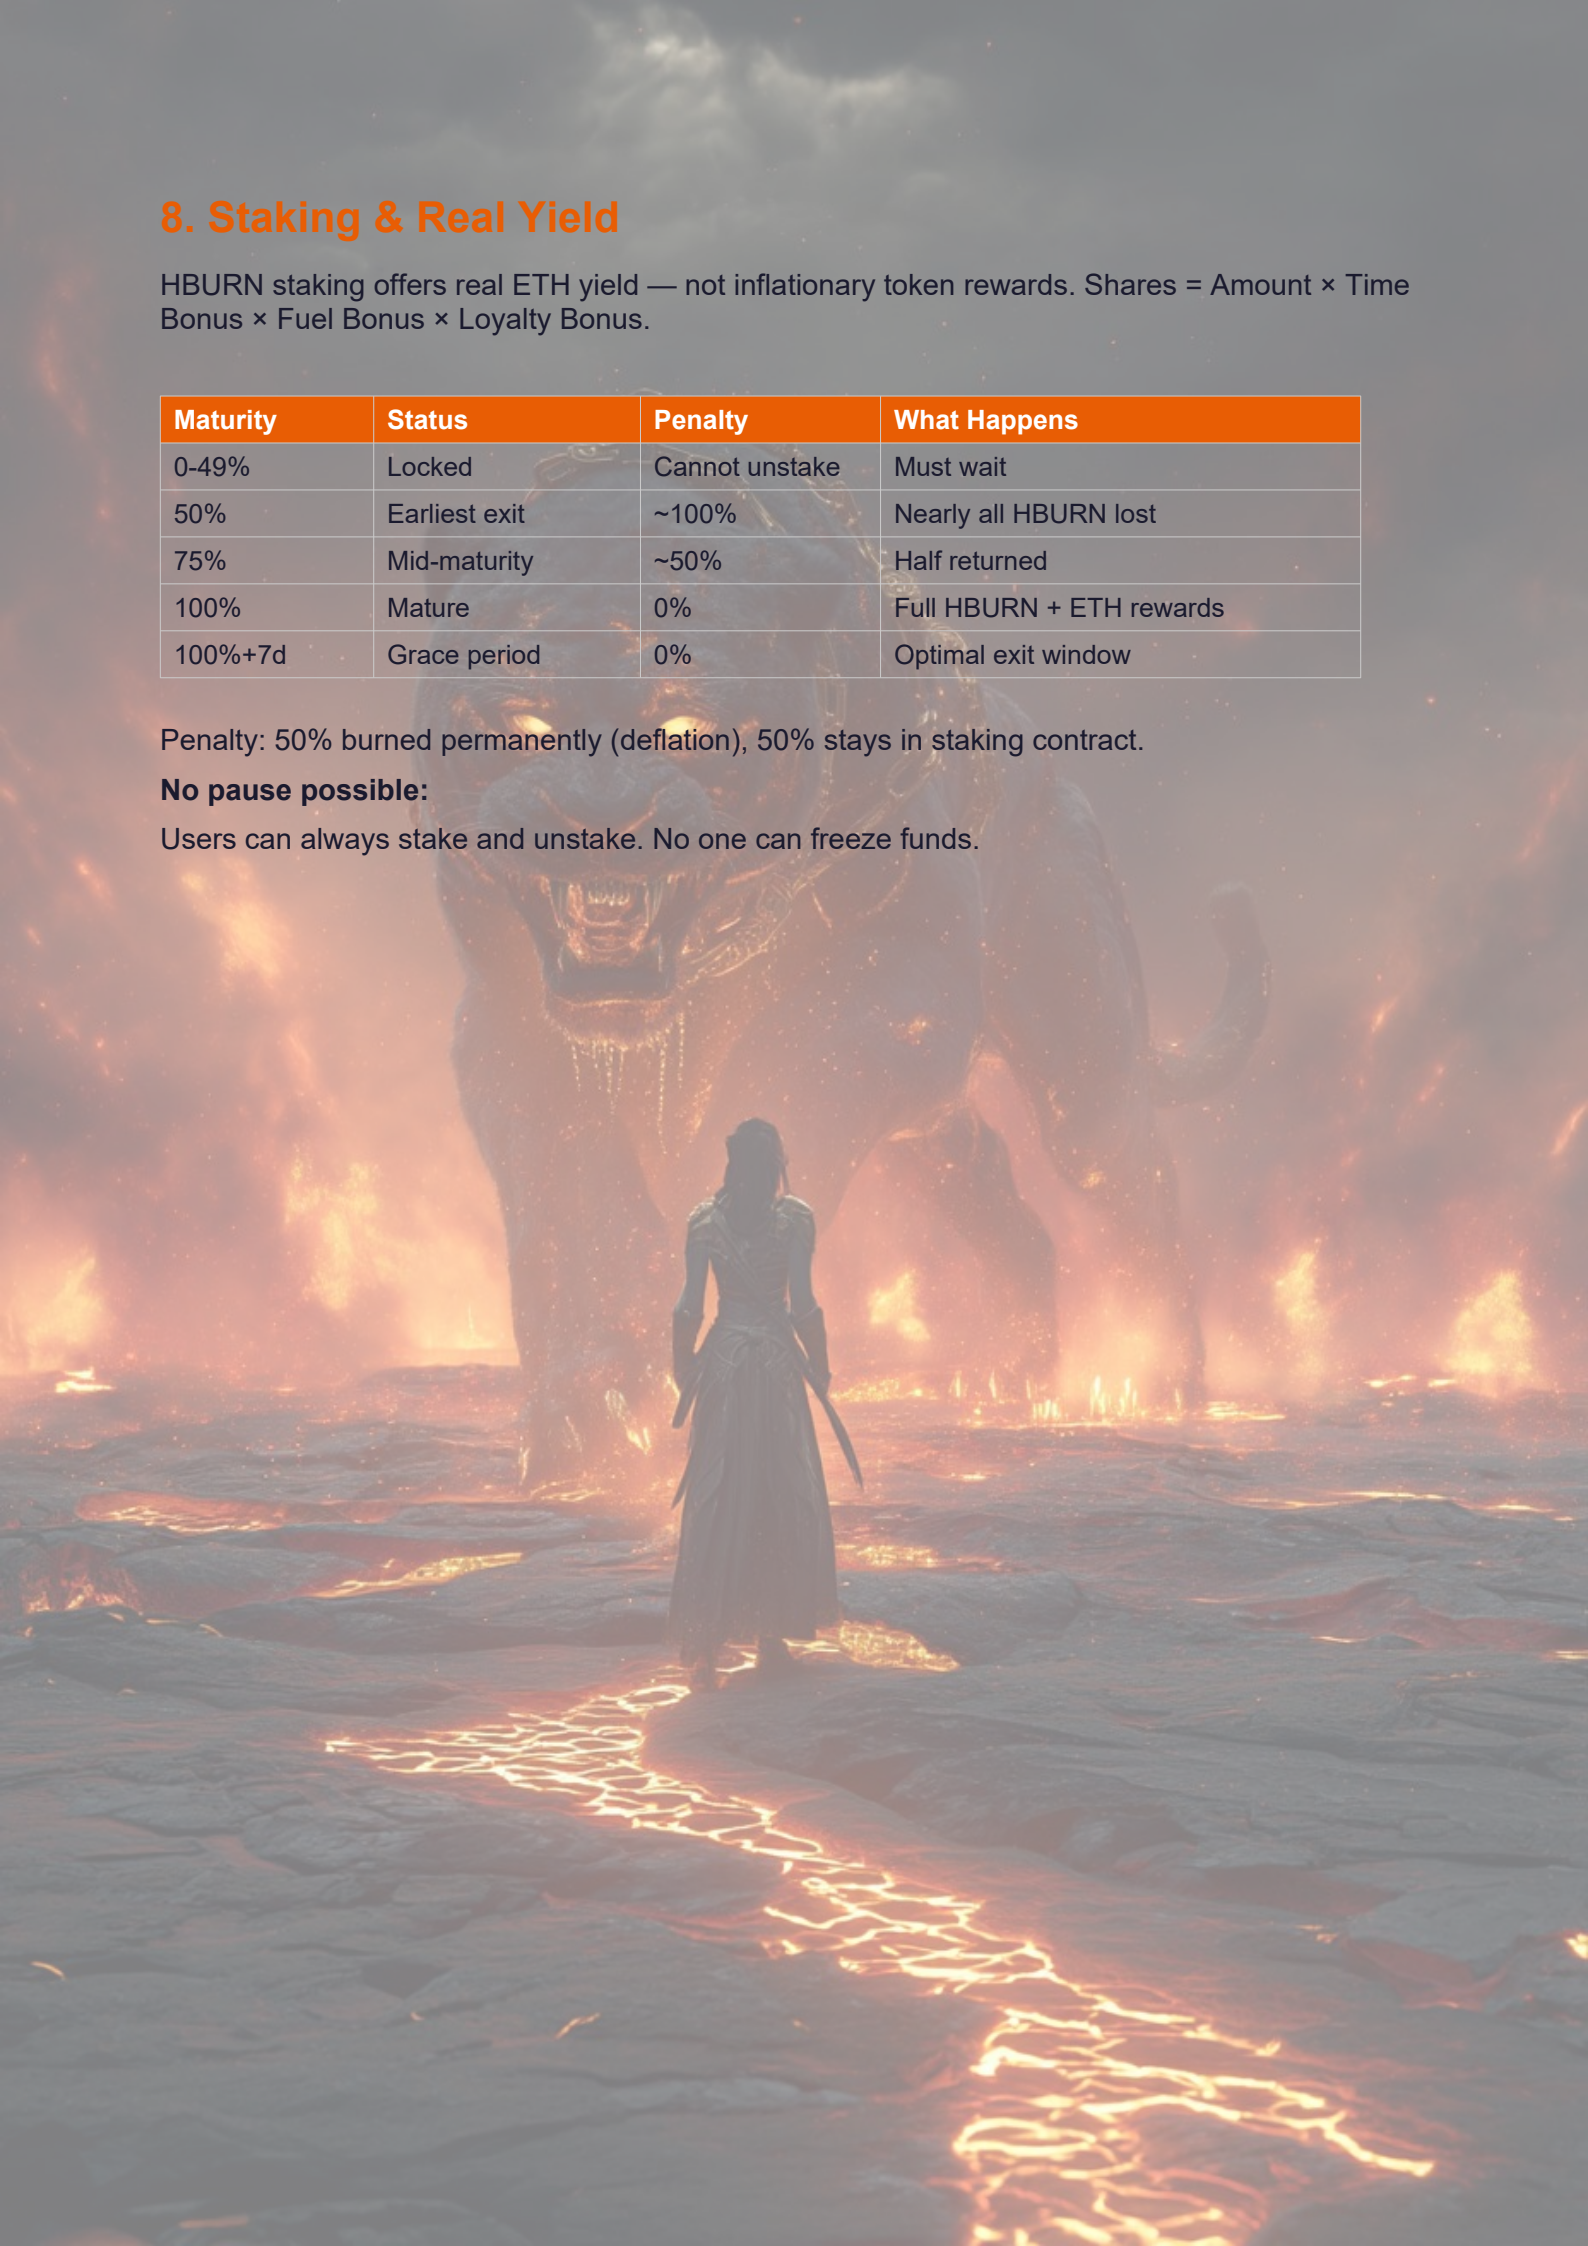
HBURN staking offers real ETH yield — not inflationary token rewards. Shares = Amount × Time Bonus × Fuel Bonus × Loyalty Bonus.

Maturity	Status	Penalty	What Happens
0-49%	Locked	Cannot unstake	Must wait
50%	Earliest exit	~100%	Nearly all HBURN lost
75%	Mid-maturity	~50%	Half returned
100%	Mature	0%	Full HBURN + ETH rewards
100%+7d	Grace period	0%	Optimal exit window

Penalty: 50% burned permanently (deflation), 50% stays in staking contract.

No pause possible:

Users can always stake and unstake. No one can freeze funds.



9. Tokenomics Deep Dive

Parameter	Value
Name / Ticker	HellBurn / HBURN
Standard	ERC-20 (Ethereum)
Total Supply	Determined by Genesis, then permanently fixed
Inflation Rate	0% — no further minting possible
LP Reserve	3% of minted HBURN → contract-created Uniswap V3 LP
Treasury	22% TitanX auto-staked for 3,500 days — yield → BuyAndBurn
Admin Keys	None — no owner, no guardian, no pause

TitanX Distribution During Genesis:

Destination	Share	Purpose
Permanent Burn	35%	Sent to dead address — gone forever
DragonX Vault	35%	Buys & locks DragonX
Treasury (in contract)	22%	Auto-staked 3,500 days → ETH yield → BuyAndBurn
Genesis Fund (LP)	8%	Stays in contract → swapped to WETH for LP

Deflationary Forces:

(1) BuyAndBurn: 20% of epoch ETH + treasury yield buys & burns HBURN. (2) Early unstake penalties: 50% burned. (3) Fuel mechanism: TitanX/DragonX burned. (4) LP fee burns: HBURN fees from locked LP burned automatically.

10. Day 888 Strategy — The Catalyst Event

TitanX Day 888 is the largest payout event: ~727 ETH (~$2.39M). HellBurn launches Genesis before Day 888 to capture a proportional share of this payout.

The 22% treasury TitanX is auto-staked inside the contract, building share allocation for the 888 payout. When the payout triggers, anyone can call claimTreasuryYield() to funnel the ETH through BuyAndBurn — creating massive buying pressure on HBURN.

11. Anti-Dump Mechanisms

HellBurn implements a six-layer anti-dump system:

Layer	Mechanism	Effect
1. Fair Launch	Contract-created LP, no insider tokens	No pre-mine dump possible
2. Trustless Treasury	22% TitanX locked in contract, yield → BuyBurn	No founder rug possible
3. Vesting	25% instant, 75% vested over 28 days	No Day-1 massive dump
4. Penalties	Locked until 50% maturity, sliding penalty	Early exits cost up to 50%
5. Loyalty	1.1x bonus on restake, Phoenix at 3 restakes	Incentivizes holding
6. Buy & Burn	20% epoch ETH + treasury yield buys & burns HBURN	Constant buy pressure

12. 12-Month Projections

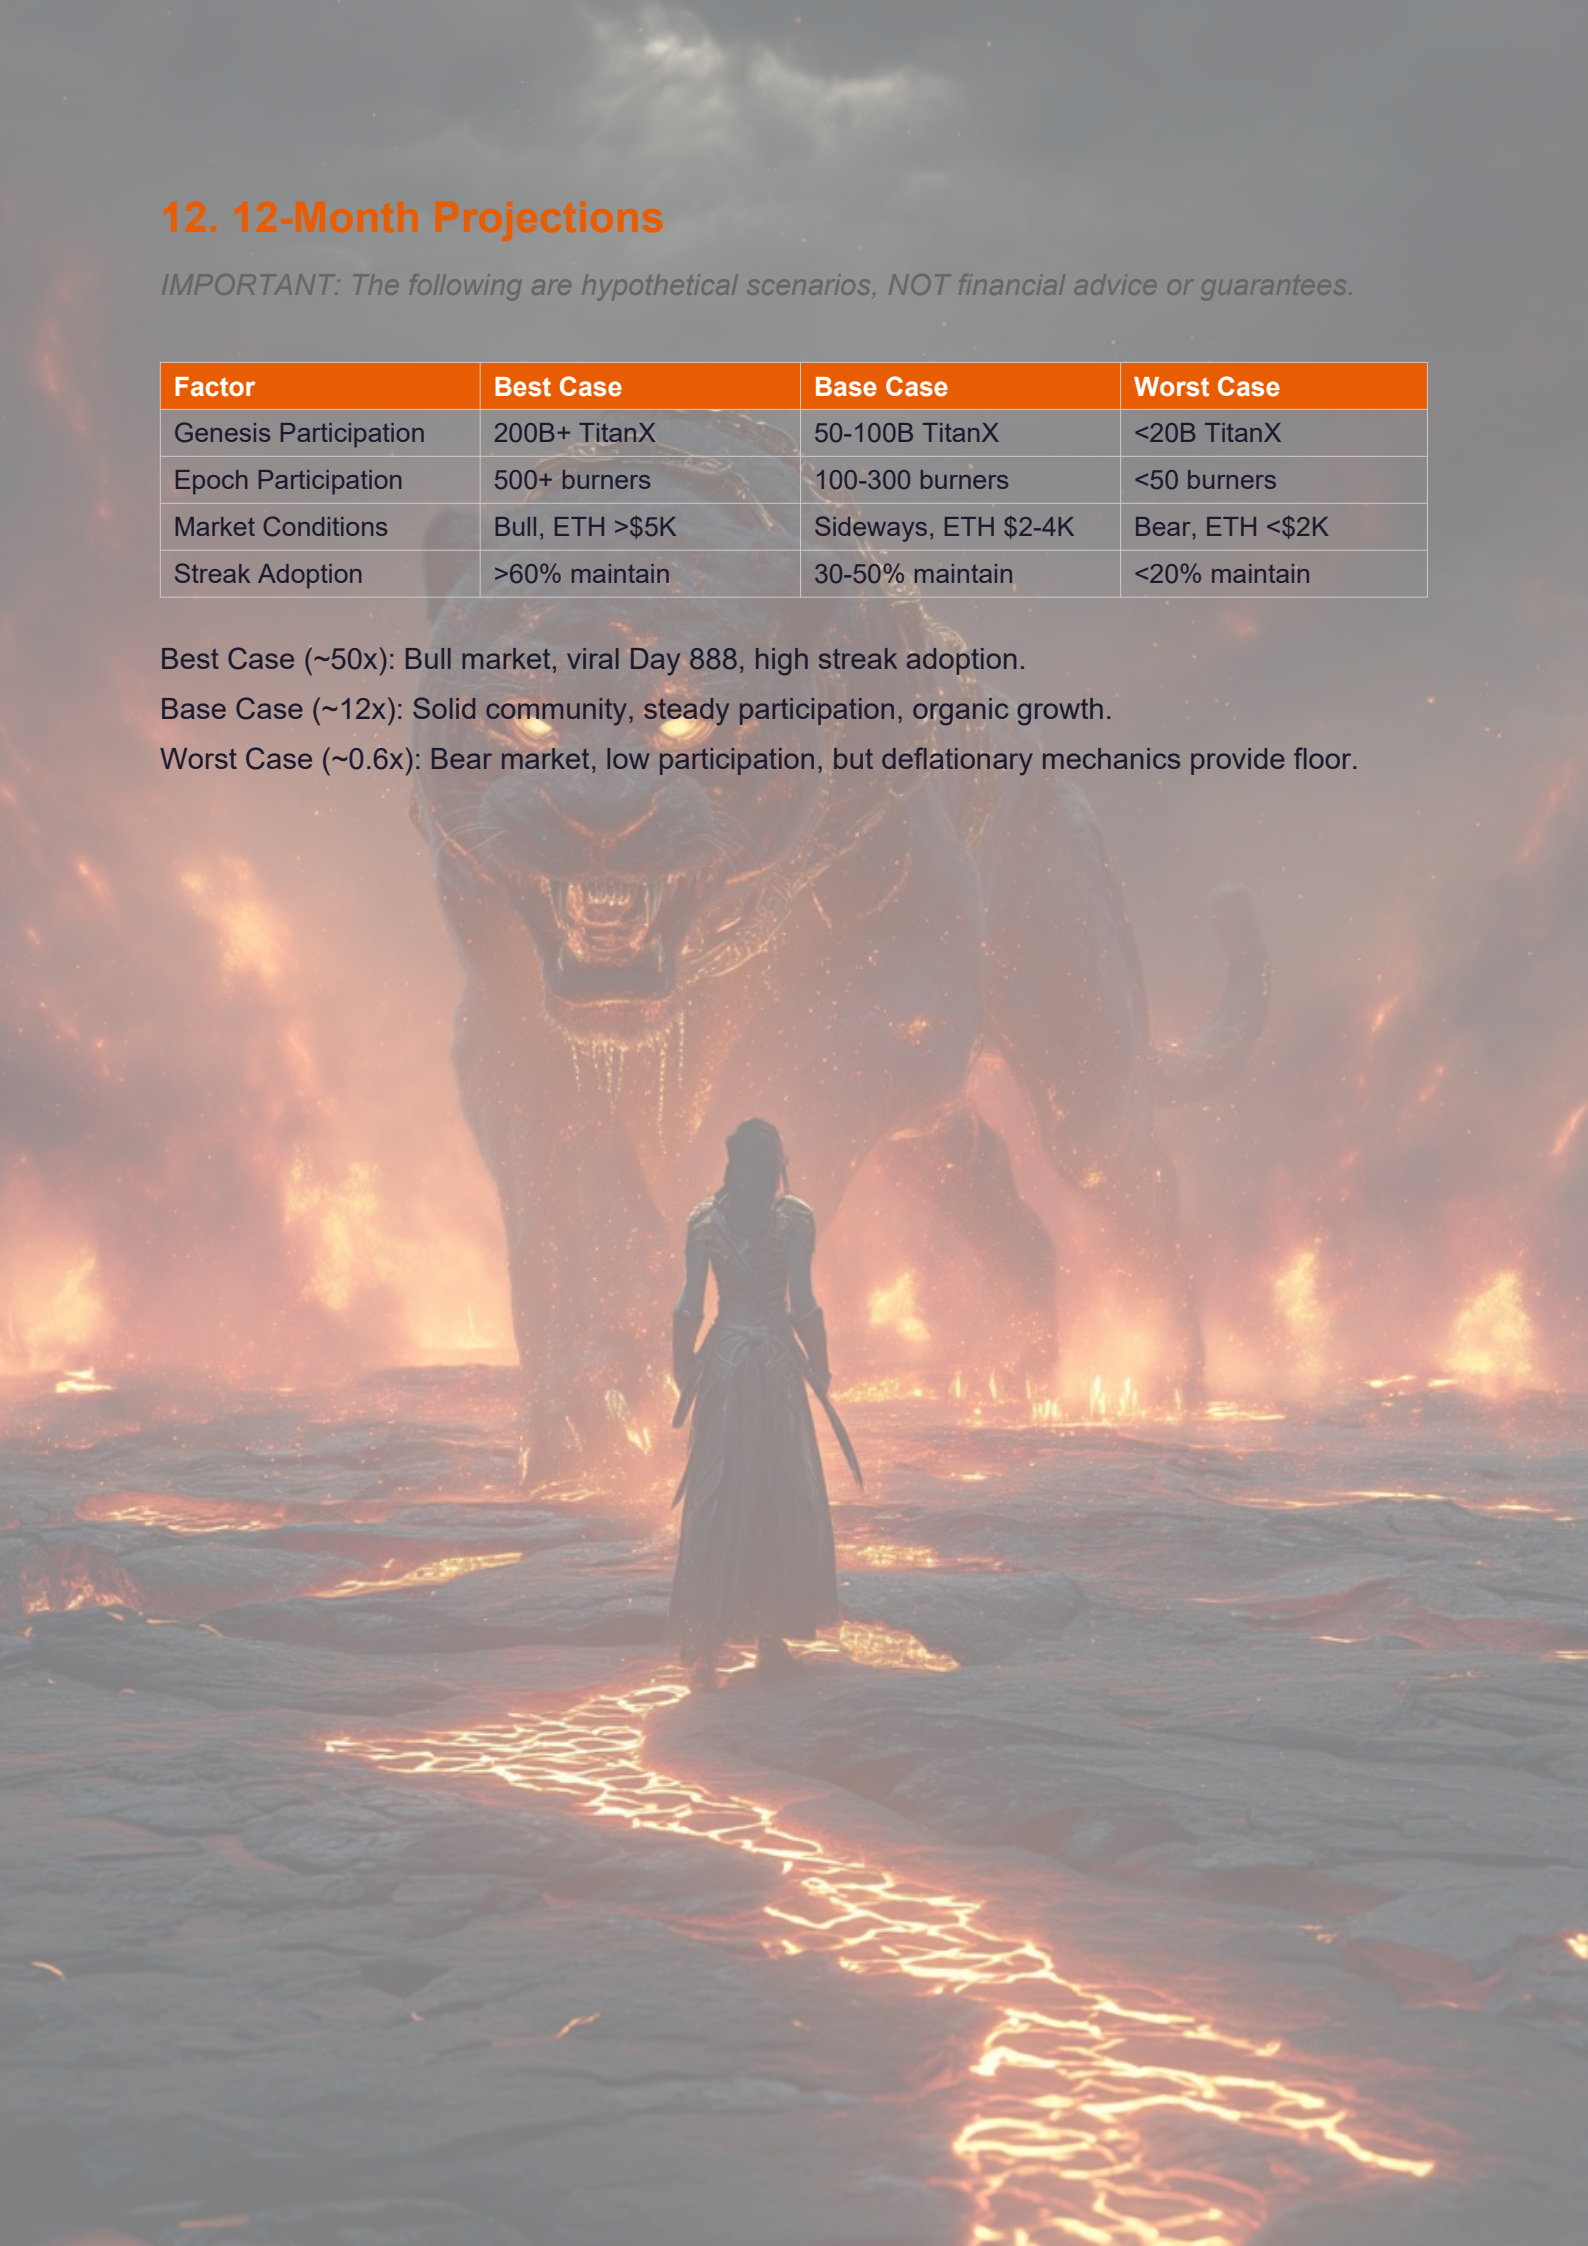
IMPORTANT: The following are hypothetical scenarios, NOT financial advice or guarantees.

Factor	Best Case	Base Case	Worst Case
Genesis Participation	200B+ TitanX	50-100B TitanX	<20B TitanX
Epoch Participation	500+ burners	100-300 burners	<50 burners
Market Conditions	Bull, ETH >$5K	Sideways, ETH $2-4K	Bear, ETH <$2K
Streak Adoption	>60% maintain	30-50% maintain	<20% maintain

Best Case (~50x): Bull market, viral Day 888, high streak adoption.

Base Case (~12x): Solid community, steady participation, organic growth.

Worst Case (~0.6x): Bear market, low participation, but deflationary mechanics provide floor.



13. Roadmap

Phase	Timeframe	Milestones
Phase 0	March 2026	Smart Contract Development, Testing, Community Building
Phase 1	Before Day 888	Deployment, Audit (incl. Trustless Delta-Audit), Genesis Launch
Phase 2	Day 888	Payout Capture, Burn Cascade, Marketing Push
Phase 3	Day 888+	Auto LP + Treasury Stake, Epoch 1, UI Launch

14. Risks & Disclaimers

Risk Category	Description	Mitigation
Smart Contract	Contracts may have undiscovered bugs	Testing, Slither analysis, SkyWolf audit
Market Risk	Crypto is extremely volatile	Deflationary mechanics provide structural support
Dependency	HellBurn depends on TitanX protocol	Diversified burns (TitanX + DragonX)
Liquidity	Initial LP may be thin	Auto-scaling with Genesis + optional manual boost
No Emergency Stop	No pause function means bugs cannot be halted	Extensive testing, immutable = no attack surface
Adoption	Protocol needs active participants	Streak system incentivizes retention

HELLBURN — Burn to Earn. Compete to Win.

Fully Trustless. No Admin Keys. No Guardian. No Pause.
